Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

1.1 Description

RISC-V RVB32E 32-bit processor model

1.2 Licensing

This Model is released under the Open Source Apache 2.0

1.3 Extensions

1.3.1 Extensions Enabled by Default

The model has the following architectural extensions enabled, and the corresponding bits in the misa CSR Extensions field will be set upon reset:

```
misa bit 4: RV32E base integer instruction set (embedded)
```

To specify features that can be dynamically enabled or disabled by writes to the misa register in addition to those listed above, use parameter "add_Extensions_mask". This is a string parameter containing the feature letters to add; for example, value "DV" indicates that double-precision floating point and the Vector Extension can be enabled or disabled by writes to the misa register, if supported on this variant. Parameter "sub_Extensions_mask" can be used to disable dynamic update of features in the same way.

Legacy parameter "misa_Extensions_mask" can also be used. This Uns32-valued parameter specifies all writable bits in the misa Extensions field, replacing any permitted bits defined in the base variant.

Note that any features that are indicated as present in the misa mask but absent in the misa will be ignored. See the next section.

1.3.2 Enabling Other Extensions

The following misa-visible extensions are supported by the model, but not enabled by default in this variant:

```
misa bit 0: extension A (atomic instructions)
misa bit 2: extension C (compressed instructions)
misa bit 3: extension D (double-precision floating point)
misa bit 5: extension F (single-precision floating point)
misa bit 7: extension H (hypervisor)
misa bit 8: RV32I/RV64I/RV128I base integer instruction set
misa bit 12: extension M (integer multiply/divide instructions)
misa bit 13: extension N (user-level interrupts)
misa bit 15: extension P (DSP instructions)
misa bit 18: extension S (Supervisor mode)
misa bit 20: extension U (User mode)
misa bit 21: extension V (vector extension)
misa bit 23: extension X (non-standard extensions present)
```

To add features from this list to the visible set in the misa register, use parameter "add_Extensions". This is a string containing identification letters of features to enable; for example, value "DV"

indicates that double-precision floating point and the Vector Extension should be enabled, if they are currently absent and are available on this variant.

Legacy parameter "misa_Extensions" can also be used. This Uns32-valued parameter specifies the reset value for the misa CSR Extensions field, replacing any permitted bits defined in the base variant.

The following implicit extensions are supported by the model, but not enabled by default in this variant:

implicit feature bit 1: extension B (bit manipulation extension)

implicit feature bit 10: extension K (cryptographic)

To add features from this list to the implicitly-enabled set (not visible in the misa register), use parameter "add_implicit_Extensions". This is a string parameter in the same format as the "add_Extensions" parameter described above.

1.4 General Features

1.4.1 mtvec CSR

On this variant, the Machine trap-vector base-address register (mtvec) is writable. It can instead be configured as read-only using parameter "mtvec_is_ro".

Values written to "mtvec" are masked using the value 0xfffffffd. A different mask of writable bits may be specified using parameter "mtvec_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec_align" defaults to 0, implying no alignment constraint.

If parameter "mtvec_sext" is True, values written to "mtvec" are sign-extended from the most-significant writable bit. In this variant, "mtvec_sext" is False, indicating that "mtvec" is not sign-extended.

The initial value of "mtvec" is 0x0. A different value may be specified using parameter "mtvec" if required.

1.4.2 Reset

On reset, the model will restart at address 0x0. A different reset address may be specified using parameter "reset_address" or applied using optional input port "reset_addr" if required.

1.4.3 NMI

An NMI input is implemented. To instead specify that NMI is not implemented, set parameter "nmi_absent" to True.

On an NMI, the model will restart at address 0x0; a different NMI address may be specified using parameter "nmi_address" or applied using optional input port "nmi_addr" if required. The

cause reported on an NMI is 0x0 by default; a different cause may be specified using parameter "ecode_nmi" or applied using optional input port "nmi_cause" if required.

If parameter "rnmi_version" is not "none", resumable NMIs are supported, managed by additional CSRs "mnscratch", "mnepc", "mncause" and "mnstatus", following the indicated version of the Resumable NMI extension proposal. In this variant, "rnmi_version" is "none".

On taking an NMI exception, the mstatus CSR will not be updated. To instead specify that mstatus fields mie and mpie should be updated upon taking an NMI exception, set parameter "nmi_update_mstatus" to True.

On taking an NMI exception, the tcontrol CSR will not be updated. To instead specify that tcontrol fields mte and mpte should be updated upon taking an NMI exception, set parameter "nmi_update_tcontrol" to True.

On taking an NMI exception, the mtval CSR will not be updated. To instead specify that mtval should be written with zero upon taking an NMI exception, set parameter "nmi_zero_mtval" to True.

The NMI input is level-sensitive. To instead specify that the NMI input is latched on the rising edge of the NMI signal, set parameter "nmi_is_latched" to True.

NMI interrupts are lower priority than Debug and Trigger Module events. To instead specify that NMI interrupts are higher priority, set parameter "nmi_high_priority" to True.

1.4.4 WFI

WFI will halt the processor until an interrupt occurs. It can instead be configured as a NOP by setting parameter "wfi_is_nop" to True.

The nominal time limit for WFI instructions can be set by parameter "TW_time_limit". In this variant, the time limit is 0 cycles.

Output signal "core_wfi_mode" indicates whether the processor is currently in WFI state.

Input signal "restart_wfi" will cause the processor to restart from WFI state when high.

Parameter "wfi_resume_not_trap" is 0 on this variant, meaning that pending wakeup events when WFI is executed will not prevent a trap occurring. if "wfi_resume_not_trap" is set to 1 then pending wakeup events when WFI is executed will cause the WFI to be treated as a NOP.

1.4.5 time CSR

The "time" CSR is implemented in this variant. Set parameter "time_undefined" to True to instead specify that "time" is unimplemented and reads of it should cause Illegal Instruction traps. Usually, the value of the "time" CSR should be provided by the platform - see section "Time and Timers" for more information.

1.4.6 mcycle CSR

The "mcycle" CSR is implemented in this variant. Set parameter "mcycle_undefined" to True to instead specify that "mcycle" is unimplemented and accesses should cause Illegal Instruction traps.

1.4.7 minstret CSR

The "minstret" CSR is implemented in this variant. Set parameter "minstret_undefined" to True to instead specify that "minstret" is unimplemented and accesses should cause Illegal Instruction traps.

1.4.8 mhpmcounter CSR

The "mhpmcounter" CSRs are implemented in this variant. Set parameter "mhpmcounter_undefined" to True to instead specify that "mhpmcounter" CSRs are unimplemented and accesses should cause Illegal Instruction traps.

1.4.9 Unaligned Accesses

Unaligned memory accesses are not supported by this variant. Set parameter "unaligned" to "T" to enable such accesses.

Address misaligned exceptions are higher priority than page fault or access fault exceptions on this variant. Set parameter "unaligned_low_pri" to "T" to specify that they are lower priority instead.

1.4.10 PMP

A PMP unit is not implemented by this variant. Set parameter "PMP_registers" to indicate that the unit should be implemented with that number of PMP entries.

The total number of PMP registers present is 64, (this includes CSRs for unimplemented PMP regions), as determined by the requirements of the selected priv_version. Set parameter "PMP_csrs" to specify a different total number of PMP registers.

Accesses to unimplemented PMP registers are write-ignored and read as zero on this variant. Set parameter "PMP_undefined" to True to indicate that such accesses should cause Illegal Instruction exceptions instead.

1.4.11 Time and Timers

A RISC-V hart requires an incrementing time source to be available in any of the following cases:

- 1. The "time" CSR is implemented ("time_undefined" is False);
- 2. The "Sstc" extension is present ("Sstc" is True);
- 3. The internal CLINT model is enabled ("CLINT_address" is non-zero).

The time value in this model is implemented by an abstract counter object, which is shared with any other processor models or peripherals that use the same name to define the counter. The name of the counter is specified by the "mtime_counter" parameter ("mtime_counter" by default). The bit width of the counter is specified by the "mtime_bits" parameter (64 by default). The frequency of the counter is specified by the "mtime_Hz" parameter (1e+06Hz by default).

1.5 Privileged Architecture

This variant implements the Privileged Architecture with version specified in the References section of this document. Note that parameter "priv_version" can be used to select the required architecture version; see the following sections for detailed information about differences between each supported version.

1.5.1 Legacy Version 1.10

1.10 version of May 7 2017.

1.5.2 Version 20190608

Stable 1.11 version of June 8 2019, with these changes compared to version 1.10:

- mcountinhibit CSR defined;
- pages are never executable in Supervisor mode if page table entry U bit is 1;
- mstatus.TW is writable if any lower-level privilege mode is implemented (previously, it was just if Supervisor mode was implemented);

1.5.3 Version 20211203

- 1.12 draft version of December 3 2021, with these changes compared to version 20190608:
- mstatush, mseccfg, mseccfgh, menvcfg, menvcfgh, senvcfg, henvcfgh and mconfigptr CSRs defined;
- xret instructions clear mstatus.MPRV when leaving Machine mode if new mode is less privileged than M-mode;
- maximum number of PMP registers increased to 64;
- data endian is now configurable.

1.5.4 Version 1.12

Official 1.12 version, identical to 20211203.

1.5.5 Version master

Unstable master version, currently identical to 1.12.

1.6 Unprivileged Architecture

This variant implements the Unprivileged Architecture with version specified in the References section of this document. Note that parameter "user_version" can be used to select the required architecture version; see the following sections for detailed information about differences between each supported version.

1.6.1 Legacy Version 2.2

2.2 version of May 7 2017.

1.6.2 Version 20191213

Stable 20191213-Base-Ratified version of December 13 2019, with these changes compared to version 2.2:

- floating point fmin/fmax instruction behavior modified to comply with IEEE 754-201x.
- numerous other optional behaviors can be separately enabled using Z-prefixed parameters.

1.7 Other Extensions

Other extensions that can be configured are described in this section.

1.7.1 Zicsr

Parameter "Zicsr" is 1 on this variant, meaning that standard CSRs and CSR access instructions are implemented. if "Zicsr" is set to 0 then standard CSRs and CSR access instructions are not implemented and an alternative scheme must be provided as a processor extension.

1.7.2 Zifencei

Parameter "Zifencei" is 1 on this variant, meaning that the fence.i instruction is implemented (but treated as a NOP by the model). if "Zifencei" is set to 0 then the fence.i instruction is not implemented.

1.7.3 **Zicbom**

Parameter "Zicbom" is 0 on this variant, meaning that code block management instructions are undefined. if "Zicbom" is set to 1 then code block management instructions cbo.clean, cbo.flush and cbo.inval are defined.

If Zicbom is present, the cache block size is given by parameter "cmomp_bytes". The instructions may cause traps if used illegally but otherwise are NOPs in this model.

1.7.4 **Zicbop**

Parameter "Zicbop" is 0 on this variant, meaning that prefetch instructions are undefined. if "Zicbop" is set to 1 then prefetch instructions prefetch.i, prefetch.r and prefetch.w are defined (but behave as NOPs in this model).

1.7.5 Zicboz

Parameter "Zicboz" is 0 on this variant, meaning that the cbo.zero instruction is undefined. if "Zicboz" is set to 1 then the cbo.zero instruction is defined.

If Zicboz is present, the cache block size is given by parameter "cmoz_bytes".

1.7.6 Smstateen

Parameter "Smstateen" is 0 on this variant, meaning that state enable CSRs are undefined. if "Smstateen" is set to 1 then state enable CSRs are defined.

These state enable bits are currently implemented:

bit 1: Zfinx extension enable

bit 2: Zcmt extension enable

bit 57: xcontext CSR access

bit 58: IMSIC CSR access

bit 59: AIA CSR access

bit 60: sireg CSR access

bit 62: xenvcfg CSR access

bit 63: lower-level state enable CSR access

1.7.7 Sscofpmf

Parameter "Sscofpmf" is 0 on this variant, meaning that count overflow and mode-based filtering extension CSRs are undefined. if "Sscofpmf" is set to 1 then count overflow and mode-based filtering extension CSRs are defined.

Note that this model implements CSR state only for this extension; hardware performance counters themselves are implementation-specific and not implemented.

1.7.8 Smcntrpmf

Parameter "Smcntrpmf" is 0 on this variant, meaning that cycle and instret mode-based filtering extension CSRs are undefined. if "Smcntrpmf" is set to 1 then cycle and instret mode-based filtering extension CSRs are defined.

1.7.9 Smcsrind

Parameter "Smcsrind" is 0 on this variant, meaning that indirect CSR access is not implemented. if "Smcsrind" is set to 1 then indirect CSR access is implemented. If Supervisor mode is implemented, this also implicitly enables Sscsrind.

1.7.10 Zawrs

Parameter "Zawrs" is 0 on this variant, meaning that wait-for-reservation-set instructions are not implemented. if "Zawrs" is set to 1 then wait-for-reservation-set instructions are implemented, in which case parameter "TW_time_limit" is used to specify the nominal cycle delay for wrs.nto, and parameter "STO_time_limit" is used to specify the nominal cycle delay for wrs.sto.

1.7.11 Zimop

Parameter "Zimop" is 0 on this variant, meaning that maybe operations are not implemented. if "Zimop" is set to 1 then maybe operations are implemented.

1.8 CLIC

The model can be configured to implement a Core Local Interrupt Controller (CLIC) using parameter "CLICLEVELS"; when non-zero, the CLIC is present with the specified number of interrupt levels (2-256), as described in the RISC-V Core-Local Interrupt Controller specification, and further parameters are made available to configure other aspects of the CLIC. "CLICLEVELS" is zero in this variant, indicating that a CLIC is not implemented.

1.9 Advanced Interrupt Architecture

The model can be configured to implement the Advanced Interrupt Architecture (AIA) interface using Boolean parameter "Smaia"; when True, the AIA interface is present as described in the RISC-V Advanced Interrupt Architecture specification, and further parameters are made available to configure other aspects of the interface. "Smaia" is False in this variant, indicating that the AIA interface is not implemented.

1.10 Interrupts

The "reset" port is an active-high reset input. The processor is halted when "reset" goes high and resumes execution from the reset address specified using the "reset_address" parameter or "reset_addr" port when the signal goes low. The "mcause" register is cleared to zero.

The "nmi" port is an active-high NMI input. The processor resumes execution from the address specified using the "nmi_address" parameter or "nmi_addr" port when the NMI signal goes high. The "mcause" register is cleared to zero.

All other interrupt ports are active high. For each implemented privileged execution level, there are by default input ports for software interrupt, timer interrupt and external interrupt; for example, for Machine mode, these are called "MSWInterrupt", "MTimerInterrupt" and "MExternalInterrupt", respectively. When the N extension is implemented, ports are also present for User mode. Parameter "unimp_int_mask" allows the default behavior to be changed to exclude certain interrupt ports. The parameter value is a mask in the same format as the "mip" CSR; any interrupt corresponding to a non-zero bit in this mask will be removed from the processor and read as zero in "mip", "mie" and "mideleg" CSRs (and Supervisor and User mode equivalents if implemented).

Parameter "external_int_id" can be used to enable extra interrupt ID input ports on each hart. If the parameter is True then when an external interrupt is taken the value on the ID port is sampled and used to fill the Exception Code field in the relevant "xcause" CSR. For Machine External interrupts, the extra interrupt ID port is called "MExternalInterruptID"; for Supervisor External interrupts, the extra interrupt ID port is called "SExternalInterruptID".

The "deferint" port is an active-high artifact input that, when written to 1, prevents any pendingand-enabled interrupt being taken (normally, such an interrupt would be taken on the next instruction after it becomes pending-and-enabled). The purpose of this signal is to enable alignment with hardware models in step-and-compare usage.

1.11 Debug Mode (Sdext)

The model can be configured to implement Debug mode using parameter "debug_mode". This implements features described in Chapter 4 of the RISC-V External Debug Support specification with version specified by parameter "debug_version" (see References). Some aspects of this mode are not defined in the specification because they are implementation-specific; the model provides infrastructure to allow implementation of a Debug Module using a custom harness. Features added are described below.

Parameter "debug_mode" can be used to specify four different behaviors, as follows:

- 1. If set to value "vector", then operations that would cause entry to Debug mode result in the processor jumping to the address specified by the "debug_address" parameter. It will execute at this address, in Debug mode, until a "dret" instruction causes return to non-Debug mode. Any exception generated during this execution will cause a jump to the address specified by the "dexc_address" parameter.
- 2. If set to value "interrupt", then operations that would cause entry to Debug mode result in the processor simulation call (e.g. opProcessorSimulate) returning, with a stop reason of

OP_SR_INTERRUPT. In this usage scenario, the Debug Module is implemented in the simulation harness.

- 3. If set to value "halt", then operations that would cause entry to Debug mode result in the processor halting. Depending on the simulation environment, this might cause a return from the simulation call with a stop reason of OP_SR_HALT, or debug mode might be implemented by another platform component which then restarts the debugged processor again.
- 4. If set to value "inject", then operations that would cause entry to Debug mode result in the processor continuing to execute from the current address in Debug mode. The harness should detect that Debug mode has been entered by monitoring the "DM" integration support register, and inject Debug-mode instructions one at a time using function opProcessorSimulateInstruction. Debug mode is exited by either an explicit write of False to the "DM" register or by execution of an injected "dret" instruction, as described by "Debug State Exit" below.

Note that parameter "debug_mode" can be also be set to "none" to specify that Sdext is not implemented.

1.11.1 Debug State Entry

The specification does not define how Debug mode is implemented. In this model, Debug mode is enabled by a Boolean pseudo-register, "DM". When "DM" is True, the processor is in Debug mode. When "DM" is False, mode is defined by "mstatus" in the usual way.

Entry to Debug mode can be performed in any of these ways:

- 1. By writing True to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate) in this case, dcsr.cause will report a cause of trigger (2);
- 2. By writing a 1 then 0 to net "haltreq" (using opNetWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate) in this case, dcsr.cause will report a cause of haltreq (3);
- 3. By writing a 1 to net "resethaltreq" (using opNetWrite) while the "reset" signal undergoes a negedge transition, followed by simulation of at least one cycle (e.g. using opProcessorSimulate) in this case, dcsr.cause will report a cause of resethaltreq (5) or haltreq (3), depending on the value of parameter "no_resethaltreq";
- 4. By executing an "ebreak" instruction when Debug mode entry for the current processor mode is enabled by dcsr.ebreakm, dcsr.ebreaks or dcsr.ebreaku in this case, dcsr.cause will report a cause of ebreak (1);
- 5. By executing a single instruction when Debug mode entry for the current processor mode is enabled by dcsr.step in this case, dcsr.cause will report a cause of step (4);
- 6. By a Trigger Module trigger, when that trigger is configured to enter Debug mode in this case, dcsr.cause will report a cause of trigger (2).

In all cases, the processor will save required state in "dpc" and "dcsr" and then perform actions described above, depending in the value of the "debug_mode" parameter.

1.11.2 Debug State Exit

Exit from Debug mode can be performed in either of these ways:

- 1. By writing False to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 2. By executing an "dret" instruction when Debug mode.

In both cases, the processor will perform the steps described in section 4.6 (Resume) of the Debug specification.

1.11.3 Debug Registers

When Debug mode is enabled, registers "dcsr" and "dpc" are implemented as described in the specification. Registers "dscratch0" and "dscratch1" may also be implemented (see parameters below). Implemented registers may be manipulated externally by a Debug Module using opProcessorRegRead or opProcessorRegWrite; for example, the Debug Module could write "dcsr" to enable "ebreak" instruction behavior as described above, or read and write "dpc" to emulate stepping over an "ebreak" instruction prior to resumption from Debug mode.

Parameter "dscratch0_undefined" is used to specify whether the "dscratch0" CSR is undefined, in which case accesses to it trap to Machine mode. In this variant, "dscratch0_undefined" is 0.

Parameter "dscratch1_undefined" is used to specify whether the "dscratch1" CSR is undefined, in which case accesses to it trap to Machine mode. In this variant, "dscratch1_undefined" is 0.

1.11.4 Debug Mode Execution

The specification allows execution of code fragments in Debug mode. A Debug Module implementation can cause execution in Debug mode by the following steps:

- 1. Write the address of a Program Buffer to the program counter using opProcessorPCSet;
- 2. If "debug_mode" is set to "halt", write 0 to pseudo-register "DMStall" (to leave halted state);
- 3. If entry to Debug mode was handled by exiting the simulation callback, call opProcessorSimulate or opRootModuleSimulate to resume simulation.

Debug mode will be re-entered in these cases:

- 1. By execution of an "ebreak" instruction; or:
- 2. By execution of an instruction that causes an exception.

In both cases, the processor will either jump to the debug exception address, or return control immediately to the harness, with stopReason of OP_SR_INTERRUPT, or perform a halt, depending on the value of the "debug_mode" parameter.

1.11.5 Debug Single Step

When in Debug mode, the processor or harness can cause a single instruction to be executed on return from that mode by setting dcsr.step. After one non-Debug-mode instruction has been executed, control will be returned to the harness. The processor will remain in single-step mode until dcsr.step is cleared.

1.11.6 Debug Event Priorities

The model supports three different models for determining which debug exception occurs when step, execute address, resethaltreq and haltreq events are all pending. These options are listed below, with highest-priority event first:

- 1. when parameter "debug_priority"="sxh": step ->execute address ->resethaltreq ->haltreq;
- 2. when parameter "debug_priority"="shx": step ->resethaltreq ->haltreq ->execute address;
- 3. when parameter "debug_priority"="hsx": resethaltreq ->haltreq ->step ->execute address.

1.11.7 Debug Ports

Port "DM" is an output signal that indicates whether the processor is in Debug mode

Port "haltreq" is a rising-edge-triggered signal that triggers entry to Debug mode (see above).

Port "resethaltreq" is a level-sensitive signal that triggers entry to Debug mode after reset (see above).

1.11.8 Debug Mode Versions

Debug mode specification has been under active development. To enable simulation of hardware that may be based on an older version of the specification, the model implements behavior for a number of versions of the specification. The differing features of these are listed below, in chronological order.

1.11.9 Version 0.13.2-DRAFT

0.13.2-DRAFT version of March 22 2019.

1.11.10 Version 0.14.0-DRAFT

0.14.0-DRAFT version of November 6 2020.

1.11.11 Version 1.0.0-STABLE

1.0.0-STABLE version of February 9 2022.

1.11.12 Version 1.0-STABLE

1.0-STABLE version of December 28 2022, with these changes compared to version 1.0.0-STABLE:

- nmi is moved from etrigger to itrigger and is now subject to the mode bits in that trigger.

1.12 Trigger Module (Sdtrig)

This model is configured with a trigger module, implementing a subset of the behavior described in Chapter 5 of the RISC-V External Debug Support specification with version specified by parameter "debug_version" (see References).

1.12.1 Trigger Module Restrictions

The model currently supports tdata1 of type 0, type 2 (mcontrol), type 3 (icount), type 4 (itrigger), type 5 (etrigger) and type 6 (mcontrol6). icount triggers are implemented for a single instruction only, with count hard-wired to 1 and automatic zeroing of mode bits when the trigger fires.

1.12.2 Trigger Module Parameters

Parameter "trigger_num" is used to specify the number of implemented triggers. In this variant, "trigger_num" is 4. Set this parameter to 0 to specify that Sdtrig is not implemented.

Parameter "tinfo" is used to specify the value of the read-only "tinfo" register, which indicates the trigger types supported and also version information which controls the behavior of "mcontrol6". In this variant, "tinfo" is 0x100807c.

Parameter "trigger_match" is used to specify the legal "match" values for triggers of types 2 and 6. This parameter is a bitmask with 1 bits corresponding to legal values; for example, a "trigger_match" of 0xd, means that triggers of types 0, 2 and 3 are supported. In this variant, "trigger_match" is 0x333f.

Parameter "tdata2_undefined" is used to specify whether the "tdata2" register is undefined, in which case reads of it trap to Machine mode. In this variant, "tdata2_undefined" is 0.

Parameter "tdata3_undefined" is used to specify whether the "tdata3" register is undefined, in which case reads of it trap to Machine mode. In this variant, "tdata3_undefined" is 0.

Parameter "tinfo_undefined" is used to specify whether the "tinfo" register is undefined, in which case reads of it trap to Machine mode. In this variant, "tinfo_undefined" is 0.

Parameter "tcontrol_undefined" is used to specify whether the "tcontrol" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "tcontrol_undefined" is 0.

Parameter "mcontext_undefined" is used to specify whether the "mcontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mcontext_undefined" is 0.

Parameter "scontext_undefined" is used to specify whether the "scontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "scontext_undefined" is 0.

Parameter "mscontext_undefined" is used to specify whether the "mscontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mscontext_undefined" is 0.

Parameter "amo_trigger" is used to specify whether load/store triggers are activated for AMO instructions. In this variant, "amo_trigger" is 0.

Parameter "no_hit" is used to specify whether the "hit" bits in tdata1 are unimplemented. In this variant, "no_hit" is 0.

Parameter "mcontext_bits" is used to specify the number of writable bits in the "mcontext" register. In this variant, "mcontext_bits" is 6.

Parameter "mvalue_bits" is used to specify the number of writable bits in the "mvalue" field in "textra32"/"textra64" registers; if zero, the "mselect" field is tied to zero. In this variant, "mvalue_bits" is 6.

Parameter "mcontrol_maskmax" is used to specify the value of field "maskmax" in the "mcontrol" register. In this variant, "mcontrol_maskmax" is 63.

1.13 Debug Mask

It is possible to enable model debug messages in various categories. This can be done statically using the "debugflags" parameter, or dynamically using the "debugflags" command. Enabled messages are specified using a bitmask value, as follows:

Value 0x002: enable debugging of PMP and virtual memory state;

Value 0x004: enable debugging of interrupt state;

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

1.14 Integration Support

This model implements a number of non-architectural pseudo-registers, commands, and other features to facilitate integration.

1.14.1 Command "setPMA -attributes <attrs>-lo <addr>-hi <addr>"

This command allows PMA attributes to be set for the address range lo:hi. The required attributes are described by the "attrs" string, which can contain any combination of these characters:

"r": allow read access

"w": allow write access

"x": allow execute access

"a": disallow unaligned accesses

"A": disallow RVMC_USER1 accesses (often AMO and LR/SC)

```
"P": disallow RVMC_USER2 accesses (often push/pop)
```

"1": allow 1-byte accesses (if none of 1248 are specified then all are allowed)

"2": allow 2-byte accesses

"4": allow 4-byte accesses

"8": allow 8-byte accesses

<space>, "-": ignored, use for formatting

The command may be used multiple times, in which case PMA attributes for later commands override those specified for earlier ones where ranges overlap. A common idiom is to deny all access to the entire memory range in the first command before adding back permissions for subregions with subsequent commands.

1.14.2 Command "getCSRIndex -name <name>"

This command returns the index number of a named CSR, or -1 if that CSR does not exist.

1.14.3 Command "listCSRs"

This command lists all implemented CSRs in index order.

1.14.4 CSR Register External Implementation

If parameter "enable_CSR_bus" is True, an artifact 16-bit bus "CSR" is enabled. Slave callbacks installed on this bus can be used to implement modified CSR behavior (use opBusSlaveNew or icmMapExternalMemory, depending on the client API). A CSR with index 0xABC is mapped on the bus at address 0xABC0; as a concrete example, implementing CSR "time" (number 0xC01) externally requires installation of a read callback at address 0xC010 on the CSR bus.

If both read and write callbacks are installed, or if a read callback is installed and the CSR is in the read-only address space, then the read callback will be used to provide the value for both true accesses and for trace and API register read (using opRegRead, etc). However, if only a read callback is installed and the CSR is in the CSR read/write address space then the callback will be used for true register reads *only*; in this case, the *model* CSR implementation will be used for trace and API register read. This idiom allows values to be injected for volatile CSRs without changing fundamental model behavior.

An artifact net, "readcsr", can also be used to override the value apparently read from a CSR without resorting to the CSR bus. When a CSR is read into a GPR that is not "x0", this net is written with a value encoding the CSR number (in bits 11:0) and destination GPR number (in bits 20:16). To use this net:

- 1. Install a net monitor callback on "readcsr" using opNetWriteMonitorAdd;
- 2. When the callback is activated, extract the encoded CSR and GPR numbers;

- 3. If the CSR number corresponds to a CSR of interest, find the OP register corresponding to the GPR using opProcessorRegByIndex;
- 4. Use opProcessorRegWrite to modify the GPR value.

1.14.5 External Stimulation of Illegal Instruction Trap

Artifact input net port "illegalinstr" allows Illegal Instruction traps to be raised externally. On a rising edge of the signal connected to this port, the hart will immediately take an Illegal Instruction trap with "xepc" set to the current program counter.

As a special case, if the hart is currently stalled by a WFI instruction ("wfi_is_nop" is False), it will be restarted and take either an Illegal Instruction or Virtual Instruction trap, based on the current processor mode and the governing TW bit.

1.15 Instruction Disassembly

This model implements a number of parameters to control instruction disassembly, as shown in trace output.

If parameter "use_hw_reg_names" is True, instruction disassembly shows hardware names x0-x31. If "use_hw_reg_names" is False, ABI names are shown instead.

If parameter "no_pseudo_inst" is True, instruction disassembly always shows true instructions. If "no_pseudo_inst" is False, pseudo-instructions are shown instead where applicable.

If parameter "show_c_prefix" is True, instruction disassembly of 16-bit instructions will include a compressed prefix (e.g. "c." or "cm."). If "show_c_prefix" is False, the compressed prefix will be omitted.

1.16 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. fence.i) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous. Data barrier instructions (e.g. fence) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Hardware Performance Monitor registers are not implemented and hardwired to zero.

1.17 Verification

All instructions have been extensively tested by Imperas, using tests generated specifically for this model and also reference tests from https://github.com/riscv/riscv-tests.

Also reference tests have been used from various sources including:

https://github.com/riscv/riscv-tests

https://github.com/ucb-bar/riscv-torture

The Imperas OVPsim RISC-V models are used in the RISC-V Foundation Compliance Framework as a functional Golden Reference:

https://github.com/riscv/riscv-compliance

where the simulated model is used to provide the reference signatures for compliance testing. The Imperas OVPsim RISC-V models are used as reference in both open source and commercial instruction stream test generators for hardware design verification, for example:

http://valtrix.in/sting from Valtrix

https://github.com/google/riscv-dv from Google

The Imperas OVPsim RISC-V models are also used by commercial and open source RISC-V Core RTL developers as a reference to ensure correct functionality of their IP.

1.18 References

The Model details are based upon the following specifications:

RISC-V Instruction Set Manual, Volume I: User-Level ISA (User Architecture Version 20191213)

RISC-V Instruction Set Manual, Volume II: Privileged Architecture (Privileged Architecture Version 1.12, equivalent to 20211203)

RISC-V External Debug Support (RISC-V External Debug Support Version 1.0-STABLE as of commit 83483b1 of 21 August 2023 (this is subject to change))

Configuration

2.1 Location

This model's VLNV is riscv.ovpworld.org/processor/riscv/1.0.

The model source is usually at:

\$IMPERAS_HOME/ImperasLib/source/riscv.ovpworld.org/processor/riscv/1.0

The model binary is usually at:

\$IMPERAS_HOME/lib/\$IMPERAS_ARCH/ImperasLib/riscv.ovpworld.org/processor/riscv/1.0

2.2 GDB Path

The default GDB for this model is: \$IMPERAS_HOME/lib/\$IMPERAS_ARCH/gdb/riscv-none-embed-gdb.

2.3 Semi-Host Library

The default semi-host library file is riscv.ovpworld.org/semihosting/pk/1.0

2.4 Processor Endian-ness

This is a LITTLE endian model.

2.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

2.6 Processor ELF code

The ELF code supported by this model is: 0xf3.

FIFO Ports

This model has no FIFO ports.

Formal Parameters

Name	Type	Description	
Fundamental		•	
user_version	Enumeration	Specify required User Architecture version	
	2.2	User Architecture Version 2.2	
	2.3	Deprecated and equivalent to 20191213	
	20190305	Deprecated and equivalent to 20191213	
	20191213	User Architecture Version 20191213	
priv_version	Enumeration	Specify required Privileged Architecture version	
-	1.10	Privileged Architecture Version 1.10	
	1.11	Privileged Architecture Version 1.11, equivalent to 20190608	
	20190405	Deprecated and equivalent to 20190608	
	20190608	Privileged Architecture Version Ratified-IMFDQC-and-Priv-v1.11	
	20211203	Privileged Architecture Version 20211203	
	1.12	Privileged Architecture Version 1.12, equivalent to 20211203	
	master	Privileged Architecture Master Branch as of commit 6bdeb58 (this is	
		subject to change)	
Smepmp_version	Enumeration	Specify required Smepmp Architecture version	
	none	Smepmp not implemented	
	0.9.5	Smepmp version 0.9.5 (deprecated and identical to 1.0)	
	1.0	Smepmp version 1.0	
numHarts	Uns32	Specify the number of hart contexts in a multiprocessor	
enable_expanded	Boolean	Specify that 48-bit and 64-bit expanded instructions are supported	
endianFixed	Boolean	Specify that data endianness is fixed (mstatus.{MBE,SBE,UBE} fields	
		are read-only)	
misa_MXL	Uns32	Override default value of misa.MXL	
misa_Extensions	Uns32	Override default value of misa. Extensions	
add_Extensions	String	Add extensions specified by letters to misa. Extensions (for example, spec-	
		ify "VD" to add V and D features)	
$sub_Extensions$	String	Remove extensions specified by letters from misa. Extensions (for example,	
		specify "VD" to remove V and D features)	
misa_Extensions_mask	Uns32	Override mask of writable bits in misa. Extensions	
$add_Extensions_mask$	String	Add extensions specified by letters to mask of writable bits in	
		misa.Extensions (for example, specify "VD" to add V and D features)	
sub_Extensions_mask	String	Remove extensions specified by letters from mask of writable bits in	
		misa.Extensions (for example, specify "VD" to remove V and D features)	
$add_implicit_Extensions$	String	Add extensions specified by letters to implicitly-present extensions not	
	a	visible in misa.Extensions	
sub_implicit_Extensions	String	Remove extensions specified by letters from implicitly-present extensions	
		not visible in misa.Extensions	
Compressed_Extension	<u> </u>		
compress_version	Enumeration	Specify required Compressed Architecture version	

	-	
	legacy	Compressed Architecture absent or legacy version
	0.70.1	Compressed Architecture Version 0.70.1
	0.70.5	Compressed Architecture Version 0.70.5
	1.0.0-RC5.7	Compressed Architecture Version 1.0.0-RC5.7
	1.0	Compressed Architecture Version 1.0
Debug_Extension		
$debug_version$	Enumeration	Specify required Debug Architecture version
	0.13.2-DRAFT	RISC-V External Debug Support Version 0.13.2-DRAFT
	0.14.0-DRAFT	RISC-V External Debug Support Version 0.14.0-DRAFT
	1.0.0-STABLE	RISC-V External Debug Support Version 1.0.0-STABLE
	1.0-STABLE	RISC-V External Debug Support Version 1.0-STABLE as of commit
	<u> </u>	83483b1 of 21 August 2023 (this is subject to change)
debug_mode	Enumeration	Specify how Debug mode is implemented (value 'none' implies Sdext is
		not implemented)
	none	Debug mode not implemented
	vector	Debug mode implemented by execution at vector
	interrupt	Debug mode implemented by interrupt
	halt	Debug mode implemented by halt
T	inject	Debug mode implemented using injected instructions
Interrupts_Exceptions		C C T I DAYAT A 1'
rnmi_version	Enumeration	Specify required RNMI Architecture version RNMI not implemented
	none	1
	0.2.1	RNMI version 0.2.1
	0.4_nmie1	RNMI version 0.4, except mnstatus.nmie=1 at reset
	0.4	RNMI version 0.4
mtvec_is_ro	Boolean	Specify whether mtvec CSR is read-only
tvec_align	Uns32	Specify hardware-enforced alignment of mtvec/stvec/utvec when Vec-
ecode_mask	Uns64	tored interrupt mode enabled Specify hardware-enforced mask of writable bits in xcause.ExceptionCode
ecode_mask ecode_nmi	Uns64	Specify xcause.ExceptionCode for NMI
nmi_absent	Boolean	Specify whether NMI input is absent
nmi_is_latched	Boolean	Specify whether NMI input is absent Specify whether NMI input is latched on rising edge (if False, it is level-
mm_is_latened	Doolean	sensitive)
nmi_high_priority	Boolean	Specify whether NMI input is higher priority than Debug and Trigger
mm_mgn_priority	Boolean	Module events
nmi_update_mstatus	Boolean	Specify whether an NMI exception updates the mstatus CSR mie and
iiiii apaate iiistata	Boolean	mpie fields
nmi_update_tcontrol	Boolean	Specify whether an NMI exception updates the tcontrol CSR mte and
initiap dates seemi of	Boolean	mpte fields
nmi_zero_mtval	Boolean	Specify whether an NMI exception writes 0 to the mtval CSR
mtval_is_ro	Boolean	Specify whether mtval CSR is read-only
tval_zero	Boolean	Specify whether mtval/stval/utval are hard wired to zero
tval_zero_ebreak	Boolean	Specify whether mtval/stval/utval are set to zero by an ebreak
tval_ii_code	Boolean	Specify whether mtval/stval contain faulting instruction bits on illegal
		instruction exception
reset_address	Uns64	Override reset vector address
nmi_address	Uns64	Override NMI vector address
CLINT_address	Uns64	Specify base address of internal CLINT model (or 0 for no CLINT)
local_int_num	Uns32	Specify number of local interrupts (excludes standard set 0 to 15 if basic
		interrupt mode is present)
unimp_int_mask	Uns64	Specify mask of unimplemented interrupts (e.g. 1<<9 indicates Supervi-
•		sor external interrupt unimplemented)
force_mideleg	Uns64	Specify mask of interrupts always delegated to lower-priority execution
		level from Machine execution level
	1	
no_ideleg	Uns64	Specify mask of interrupts that cannot be delegated to lower-priority

no_edeleg	Uns64	Specify mask of exceptions that cannot be delegated to lower-priority execution levels
external_int_id	Boolean	Whether to add nets allowing External Interrupt ID codes to be forced
Simulation_Artifact		<u> </u>
leaf_hart_prefix	String	Specify string name prefix for harts in a cluster
mtime_counter	String	Specify name of shared mtime counter
mtime_Hz	Double	Specify mtime counter frequency
mtime_bits	Uns32	Specify mtime counter bit width
use_hw_reg_names	Boolean	Specify whether to use hardware register names x0-x31 and f0-f31 instead of ABI register names
no_pseudo_inst	Boolean	Specify whether pseudo-instructions should not be reported in trace and disassembly
verbose	Boolean	Specify verbose output messages
traceVolatile	Boolean	Specify whether volatile registers (e.g. minstret) should be shown in change trace
wfi_restart	Boolean	Specify whether to automatically restart from WFI state when model is simulated
enable_CSR_bus	Boolean	Add artifact CSR bus port, allowing CSR registers to be externally implemented
CSR_remap	String	Comma-separated list of CSR number mappings, each of the form <csr-name>=<number></number></csr-name>
Memory		
unaligned_low_pri	Boolean	Specify whether address misaligned exceptions are lower priority than page or access fault exceptions
unaligned	Boolean	Specify whether the processor supports unaligned memory accesses
Instruction_CSR_Behavior		
wfi_is_nop	Boolean	Specify whether WFI should be treated as a NOP (if not, halt while waiting for interrupts)
wfi_resume_not_trap	Boolean	Specify whether pending wakeup events should cause WFI to be treated as a NOP instead of taking a trap
TW_time_limit	Uns32	Specify nominal cycle timeout for instructions controlled by mstatus.TW
counteren_mask	Uns32	Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers
noinhibit_mask	Uns32	Specify hardware-enforced mask of always-zero bits in mcountinhibit register
cycle_undefined	Boolean	Specify that the cycle CSR is undefined
mcycle_undefined	Boolean	Specify that the mcycle CSR is undefined
time_undefined	Boolean	Specify that the time CSR is undefined
instret_undefined	Boolean	Specify that the instret CSR is undefined
minstret_undefined	Boolean	Specify that the minstret CSR is undefined
hpmcounter_undefined	Boolean	Specify that the hpmcounter CSRs are undefined
mhpmcounter_undefined	Boolean	Specify that the mhpmcounter CSRs are undefined
CSR_Masks	e	
mtvec_mask tdata1_mask	Uns64 Uns64	Specify hardware-enforced mask of writable bits in mtvec register Specify hardware-enforced mask of writable bits in Trigger Module tdata1
		register
mip_mask	Uns64	Specify hardware-enforced mask of writable bits in mip register
envcfg_mask	Uns64	Specify hardware-enforced mask of writable bits in envcfg registers
mtvec_sext	Boolean	Specify whether mtvec is sign-extended from most-significant bit
Trigger	D 1	
tdata2_undefined	Boolean	Specify that the tdata2 CSR is undefined
tdata3_undefined	Boolean	Specify that the tdata3 CSR is undefined
tinfo_undefined	Boolean	Specify that the tinfo CSR is undefined
tcontrol_undefined	Boolean	Specify that the tcontrol CSR is undefined
mcontext_undefined	Boolean	Specify that the mcontext CSR is undefined
scontext_undefined	Boolean	Specify that the scontext CSR is undefined

mo_trigger Boolean Specify whether AMO load/store operations activate triggers no_hit Boolean Specify that tdata1.hit* bits are unimplemented trigger_num Uns32 Specify the number of implemented hardware triggers (0 implies Sdtrig is not implemented) mask_tselect Boolean Whether values written to tselect are masked according to the trigger_num setting Override tinfo register (for all triggers) trigger_match Uns32 Specify legal "match" values for triggers of type 2 and 6 (bitmask) mcontext_bits Uns32 Specify the number of implemented bits in mcontext mvalue_bits Uns32 Specify the number of implemented bits in textra.mvalue (if zero, textra.mselect is tied to zero) mcontrol_maskmax Uns32 Specify mcontrol.maskmax value chain_tval Enumeration Specify which trigger provides xtval when triggers are chained first first matching trigger provides xtval alsat last matching trigger provides xtval (prefer non-epc) last_non_epc last matching trigger provides xtval (prefer non-epc) PMP Configuration PMP_grain Uns32 Specify PMP region granularity, G (0 =>4 bytes, 1 =>8 bytes, etc) PMP_registers Uns32 Specify the number of supported PMP regions PMP_cors Uns32 Specify the number of supported PMP regions pmP_ness Uns32 Specify the number of supported PMP regions PMP_max_page Uns32 Specify the maximum size of PMP region to map if non-zero (may improve performance; constrained to a power of two) PMP_decompose Boolean Whether unaligned PMP accesses are decomposed into separate aligned accesses	mscontext_undefined	Boolean	Specify that the mscontext CSR is undefined (Debug Version 0.14.0 and
Boolean Specify that tdatal.hit* bits are unimplemented triggers (0 implies Sdirig is not implemented)			later)
trigger_mm Uns32 Specify the number of implemented hardware triggers (0 implies Sdtrig is not implemented) mask tselect	amo_trigger		
is not implemented) Myteber values written to teelect are masked according to the trigger.masket. Whether values written to teelect are masked according to the trigger. Introduced tinfo register (for all triggers) Voerride tinfo register (value for triggers) Voerride tinfo register (value for the triggers) Voerride tinfo register (value for all triggers) Voerride tinfo registers are chained for all triggers provides xtval when triggers are chained for all triggers provides xtval (prefer non-epc) Voerride tinfo registers (value for all triggers) Voerride tinfo registers (value for all triggers) Voerride tinfo registers (value fo	no_hit	I	Specify that tdata1.hit* bits are unimplemented
mask.tselect Boolean Whether values written to tselect are masked according to the trigger_match Uns32 Override tinfo register (for all triggers) Volume trigger_match Uns32 Specify legal "match" values for triggers of type 2 and 6 (bitmask) Nomentext_bits Uns32 Specify the number of implemented bits in mountext Uns32 Specify the number of implemented bits in textra.mwalue (if zero, textra.mselect is tied to zero) mountot_maskmax Uns32 Specify the number of implemented bits in textra.mwalue (if zero, textra.mselect is tied to zero) mountot_maskmax Uns32 Specify mountrol.maskmax value hain.tval Enumeration First matching trigger provides xtval when triggers are chained first.mon_epc last matching trigger provides xtval (prefer non-epc) last non-epc last non	trigger_num	Uns32	
trigger_match Uns22 Specify legal "match" values for triggers of type 2 and 6 (bitmask) mountext_bits mvalue_bits Uns32 Specify the number of implemented bits in mountext mvalue_bits Uns32 Specify the number of implemented bits in textra_mvalue (if zero, textra_msclet is tied to zero) mcontrol_maskmax Uns32 Specify which trigger provides xtval when triggers are chained first first first matching trigger provides xtval when triggers are chained first_non_epc first_non_epc last_non_epc last_matching trigger provides xtval (prefer non-epc) last_non_epc last_non_epc last_matching trigger provides xtval (prefer non-epc) last_non_epc last_non_epc last_matching trigger provides xtval (prefer non-epc) PMP_grain PMP_grain Uns32 Specify PMP region granularity, G (0 ->4 bytes, 1 ->8 bytes, etc) PMP_registers Uns32 Specify the number of supported PMP regions PMP_max_page Uns32 Specify the maximum size of PMP address CSRs (are RAZ/WI if corresponding region is not implemented) PMP_max_page Uns32 Specify the maximum size of PMP region to map if non-zero (may improve performance; constrained to a power of two) PMP_decompose Boolean Whether accesses to unimplemented PMP registers are undefined (if True) or write ignored and zero (if False) PMP_nowl1 Enumeration Specify behavior of PAPP RWX field on illegal write with R=0 and W=1 RWX_000Y set R=0 and W=0, modify X RWX_DPX RW	mask_tselect	Boolean	Whether values written to tselect are masked according to the trig-
trigger match Uns32 Specify legal "match" values for triggers of type 2 and 6 (bitmask) montext_bits Uns32 Specify the number of implemented bits in textra.mvalue (if zero, textra.mslue, bits in textra.mvalue) Uns32 Specify the number of implemented bits in textra.mvalue (if zero, textra.mslue) Chain_tval Enumeration Specify first matching trigger provides xtval when triggers are chained first.non.epc last.non.epc la	tinfo	Uns32	
meontext_bits Uns32 Specify the number of implemented bits in meontext tra-msulue, bits Uns32 Specify the number of implemented bits in textra-mvalue (if zero, textra-mselect is tied to zero) Months		I	
myalue.bits Uns32 Specify the number of implemented bits in textra.myalue (if zero, textra.mselect is tied to zero) mcontrol_maskmax Uns32 Specify montrol.maskmax value Enumeration Specify which trigger provides xtval when triggers are chained first.non.epc last matching trigger provides xtval foreir non-epc last.non.epc last.non.epc last matching trigger provides xtval (prefer non-epc) last.non.epc last.non.epc last matching trigger provides xtval (prefer non-epc) last.non.epc last.non.

Zimop	Boolean	Specify that Zimop is implemented
Zicfilp	Boolean	Specify that Zicfilp is implemented
Zawrs	Boolean	Specify that Zawrs is implemented
CSR_Defaults		
mvendorid	Uns64	Override mvendorid register
marchid	Uns64	Override marchid register
mimpid	Uns64	Override mimpid register
mhartid	Uns64	Override mhartid register (or first mhartid of an incrementing sequence
		if this is an SMP variant)
mconfigptr	Uns64	Override mconfigptr register
mtvec	Uns64	Override mtvec register
mseccfg	Uns64	Override mseccfg register
Fast_Interrupt		
CLICLEVELS	Uns32	Specify number of interrupt levels implemented by CLIC, or 0 if CLIC
		absent
AIA_Interrupts		
Smaia	Boolean	Specify that Smaia CSRs are present

Table 8.1: Parameters that can be set in: Hart

8.1 Parameters with enumerated types

8.1.1 Parameter user_version

Set to this value	Description
2.2	User Architecture Version 2.2
2.3	Deprecated and equivalent to 20191213
20190305	Deprecated and equivalent to 20191213
20191213	User Architecture Version 20191213

Table 8.2: Values for Parameter user_version

8.1.2 Parameter priv_version

Set to this value	Description
1.10	Privileged Architecture Version 1.10
1.11	Privileged Architecture Version 1.11, equivalent to 20190608
20190405	Deprecated and equivalent to 20190608
20190608	Privileged Architecture Version Ratified-IMFDQC-and-Priv-v1.11
20211203	Privileged Architecture Version 20211203
1.12	Privileged Architecture Version 1.12, equivalent to 20211203
master	Privileged Architecture Master Branch as of commit 6bdeb58 (this is subject to change)

Table 8.3: Values for Parameter priv_version

8.1.3 Parameter compress_version

Set to this value	Description
legacy	Compressed Architecture absent or legacy version
0.70.1	Compressed Architecture Version 0.70.1
0.70.5	Compressed Architecture Version 0.70.5
1.0.0-RC5.7	Compressed Architecture Version 1.0.0-RC5.7

1.0 Compressed Architecture Version 1.0

Table 8.4: Values for Parameter compress_version

8.1.4 Parameter debug_version

Set to this value	Description
0.13.2-DRAFT	RISC-V External Debug Support Version 0.13.2-DRAFT
0.14.0-DRAFT	RISC-V External Debug Support Version 0.14.0-DRAFT
1.0.0-STABLE	RISC-V External Debug Support Version 1.0.0-STABLE
1.0-STABLE	RISC-V External Debug Support Version 1.0-STABLE as of commit 83483b1 of 21 August 2023
	(this is subject to change)

Table 8.5: Values for Parameter debug_version

8.1.5 Parameter rnmi_version

Set to this value	Description
none	RNMI not implemented
0.2.1	RNMI version 0.2.1
0.4_nmie1	RNMI version 0.4, except mnstatus.nmie=1 at reset
0.4	RNMI version 0.4

Table 8.6: Values for Parameter rnmi_version

8.1.6 Parameter Smepmp_version

Set to this value	Description
none	Smepmp not implemented
0.9.5	Smepmp version 0.9.5 (deprecated and identical to 1.0)
1.0	Smepmp version 1.0

Table 8.7: Values for Parameter Smepmp_version

8.1.7 Parameter debug_mode

Set to this value	Description
none	Debug mode not implemented
vector	Debug mode implemented by execution at vector
interrupt	Debug mode implemented by interrupt
halt	Debug mode implemented by halt
inject	Debug mode implemented using injected instructions

Table 8.8: Values for Parameter debug_mode

8.1.8 Parameter chain_tval

Set to this value	Description
first	first matching trigger provides xtval
last	last matching trigger provides xtval
first_non_epc	first matching trigger provides xtval (prefer non-epc)
last_non_epc	last matching trigger provides xtval (prefer non-epc)

Table 8.9: Values for Parameter chain_tval

8.1.9 Parameter PMP_R0W1

Set to this value	Description
RWX_00X	set R=0 and W=0, modify X
RWX_00P	set R=0 and W=0, preserve X
RWX_11X	set R=1 and W=1, modify X
RWX_PPX	preserve previous R and W, modify X
RWX_PPP	preserve previous RWX
RWX_000	set RWX=000

Table 8.10: Values for Parameter PMP_R0W1

8.1.10 Parameter Smmpm

Set to this value	Description
none	pointer masking not implemented
48	PM=XLEN-48 is implemented
57	PM=XLEN-57 is implemented
48_57	PM=XLEN-48 and PM=XLEN-57 are implemented

Table 8.11: Values for Parameter Smmpm

8.2 Parameter values and limits

These are the formal parameter limits and actual parameter values

Table 8.12: Parameter values and limits

Execution Modes

Mode	Code	Description
Machine	3	Machine mode

Table 9.1: Modes implemented in: Hart

Exceptions

Exception	Code	Description
InstructionAddressMisaligned	0	Fetch from unaligned address
InstructionAccessFault	1	No access permission for fetch
IllegalInstruction	2	Undecoded, unimplemented or disabled instruc-
		tion
Breakpoint	3	EBREAK instruction executed
LoadAddressMisaligned	4	Load from unaligned address
LoadAccessFault	5	No access permission for load
StoreAMOAddressMisaligned	6	Store/atomic memory operation at unaligned
		address
StoreAMOAccessFault	7	No access permission for store/atomic memory
		operation
EnvironmentCallFromMMode	11	ECALL instruction executed in Machine mode
MSWInterrupt	67	Machine software interrupt
MTimerInterrupt	71	Machine timer interrupt
MExternalInterrupt	75	Machine external interrupt
GenericNMI	4294967295	Generic NMI

Table 10.1: Exceptions implemented in: Hart

Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

11.1 Level 1: Hart

This level in the model hierarchy has 6 commands.

This level in the model hierarchy has 3 register groups:

Group name	Registers
Core	17
Machine_Control_and_Status	260
Integration_support	2

Table 11.1: Register groups

This level in the model hierarchy has no children.

Model Commands

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.

12.1 Level 1: Hart

12.1.1 debugflags

show or modify the processor debug flags

Argument	Type	Description
-get	Boolean	print current processor flags value
-mask	Boolean	print valid debug flag bits
-set	Int32	new processor flags (only flags 0x00000006 can
		be modified)

Table 12.1: debugflags command arguments

12.1.2 getCSRIndex

Return index for a named CSR (or -1 if no matching CSR)

Argument	Type	Description
-name	String	CSR name

Table 12.2: getCSRIndex command arguments

12.1.3 isync

specify instruction address range for synchronous execution

Argument	Type	Description
-addresshi	Uns64	end address of synchronous execution range
-addresslo	Uns64	start address of synchronous execution range

Table 12.3: isync command arguments

12.1.4 itrace

enable or disable instruction tracing

Argument	Type	Description
-access	String	show memory accesses by this instruction. Ar-
		gument can be any combination of X (execute),
		A (load or store access) and S (system)
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing
-full	Boolean	turn on all trace features
-instructioncount	Boolean	include the instruction number in each trace
-memory	String	(Alias for access). show memory accesses by this
		instruction. Argument can be any combination
		of X (execute), A (load or store access) and S
		(system)
-mode	Boolean	show processor mode changes
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-processorname	Boolean	Include processor name in all trace lines
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 12.4: itrace command arguments

12.1.5 listCSRs

12.1.5.1 Argument description

List all CSRs in index order

12.1.6 setPMA

Set PMA region permissions and legal access sizes

Argument	Type	Description
-attributes	String	region attributes (string containing r, w, x, a,
		A, P, 1, 2, 4 or 8)
-hi	Uns64	high address
-lo	Uns64	low address

Table 12.5: setPMA command arguments

Registers
